# Introduction – Recap of 2008 Workshop

## Modelled male mesothelioma deaths and claims

# Working Party Plans for 2008/9

- Understand revised future population projection of deaths due to mesothelioma by the HSE / Peto and update working party model if appropriate.
- Further explore key drivers of claims to deaths ratio.
- Develop average cost per claim model.
- Update UK insurance industry estimates for asbestos-related claims.

# Content

- Mesothelioma population deaths projections
- Claimant to deaths ratio
- Mesothelioma average cost per claim model
- Insurance industry mesothelioma projections
- Insurance industry non -mesothelioma projections

ALL FIGURES PRESENTED IN THIS  
WORKSHOP ARE DRAFT - FINAL  
ESTIMATES WILL BE PUBLISHED IN  
OUR PAPER LATER THIS YEAR

# Mesothelioma Deaths' Projections

- AWP considered three model structures:
  - Latency Model
  - Simple Birth Cohort Model
  - HSE/HSL Model
  
- The three models are summarised as follows:

# Latency Model

Past Import Data and assumed 'risk' relativities

Create 'index' for propensity to develop mesothelioma

# Latency Model

## Advantages:

- common sense approach
- 'real-world' inputs
- can achieve a good fit

## Disadvantages:

- projection very sensitive to inputs
- ...and key assumption choices very subjective
- implicit population assumption

# Simple Birth Cohort Model

- analyse age-specific death rates
- by birth cohort

# Simple Birth Cohort Model

## Advantages:

- simple structure
- allows for relative differences between YOB cohorts

## Disadvantages:

- background deaths may 'swamp' low value cells
  - factor selection and fitting not straightforward
  - incomplete observations...
  - reliance on future population projections
  - projection largely dependent on incomplete cohorts
-

# Major Disadvantage

...consider development of the incident rates...

# Development of Incidence Rates

Development of death rates between age bands for different YOB cohorts

# Development of Incidence Rates

Development of death rates between age bands for different YOB cohorts

# Development of Incidence Rates

Development of death rates between age bands for different YOB cohorts

# Development of Incidence Rates

Development of death rates between age bands for different YOB cohorts

# Development of Incidence Rates

Development of death rates between age bands for different YOB cohorts

# Development of Incidence Rates

Development of death rates between age bands for different YOB cohorts

# Development of Incidence Rates

Development of death rates between age bands for different YOB cohorts

# Development of Incidence Rates

Development of death rates between age bands for different YOB cohorts

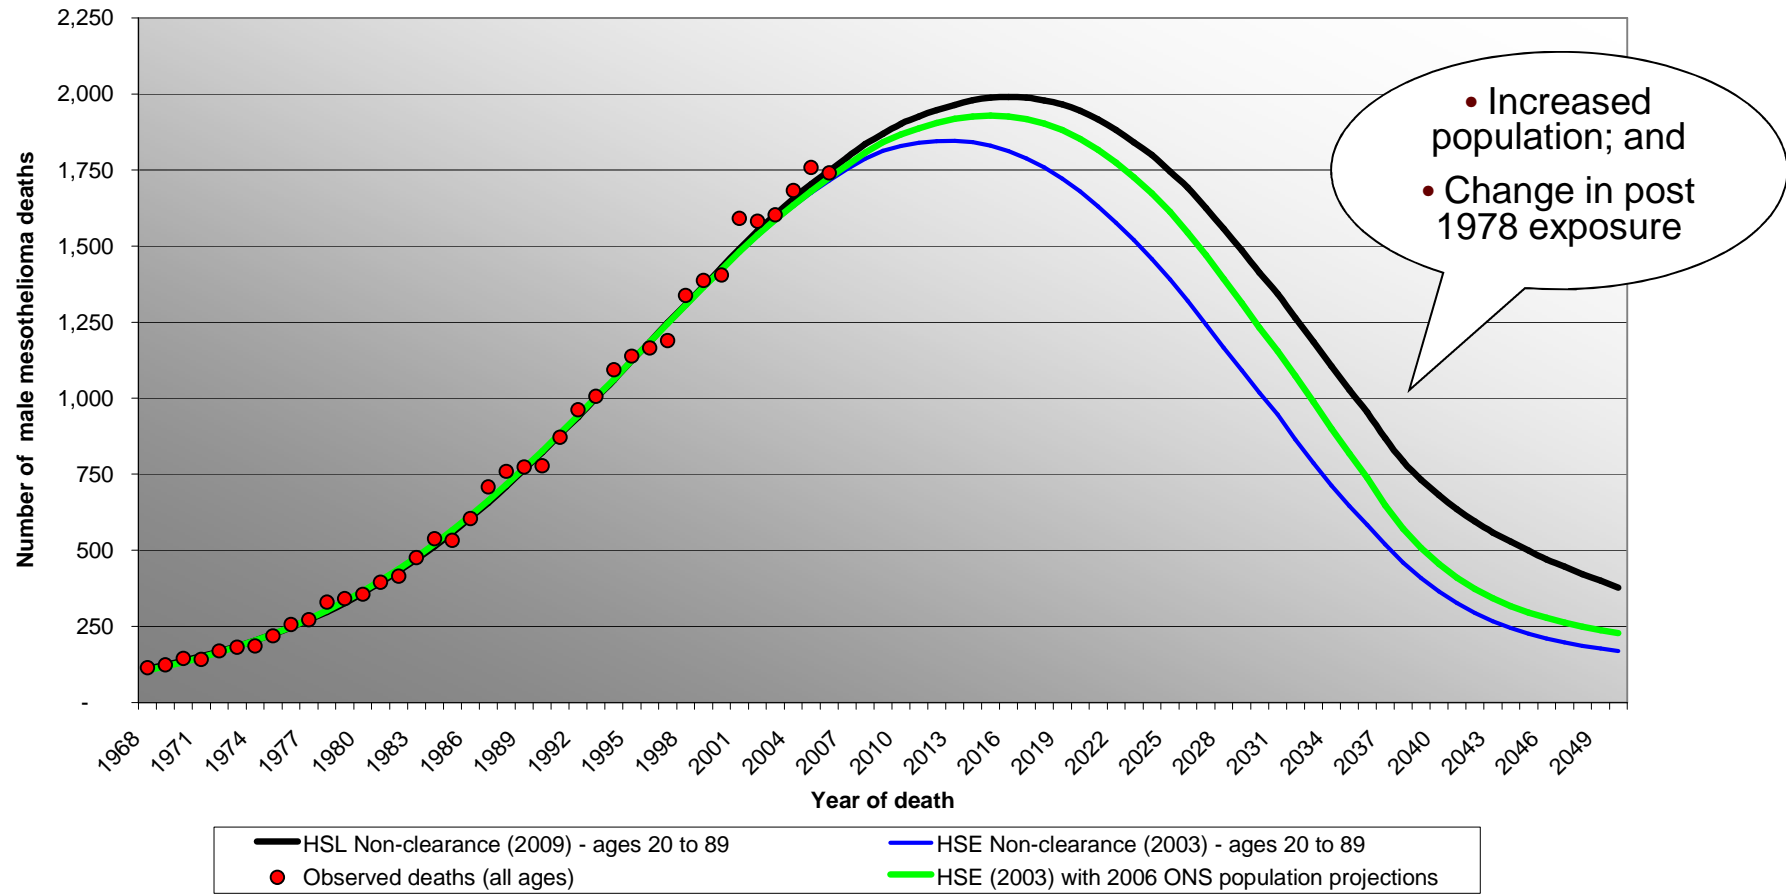

# HSE/HSL parameters

- **Background rate**  
Deaths not related to exposure from asbestos
- **Exposure level**  
Exposure at any year for 20-29 year olds
- **Age-specific exposure**  
Scale factor for exposure given the age at that point in time
- **Population**  
GB historic and projected
- **Exponent of time (k)**  
Increasing risk of developing mesothelioma since exposure
- **Half-life (H)**  
Clearance of fibres from the lung
- **Diagnostic trend**  
Percentage of mesothelioma deaths diagnosed in any year

# Comparing HSE/HSL to 2003

Male mesothelioma deaths (includes background deaths)

# HSE/HSL Model

## Pros

- More flexible as a result of its many parameters
- Allows different death rates
- Takes into account exposure explicitly

## Cons

- Lots of parameters – difficult to parameterise
- May overestimate the number of deaths from 80+ year olds
- Uses GB population and not exposed population

# AWP scenario assumptions

## ***Base***

- Exposure post-1978 based on imports
- Cap on k for 60+ years since exposure
  - This stops the risk of developing mesothelioma continuing to increase 60 years from exposure; and
  - Reduces 80+ old years deaths.
- No exposure for 50+ year olds

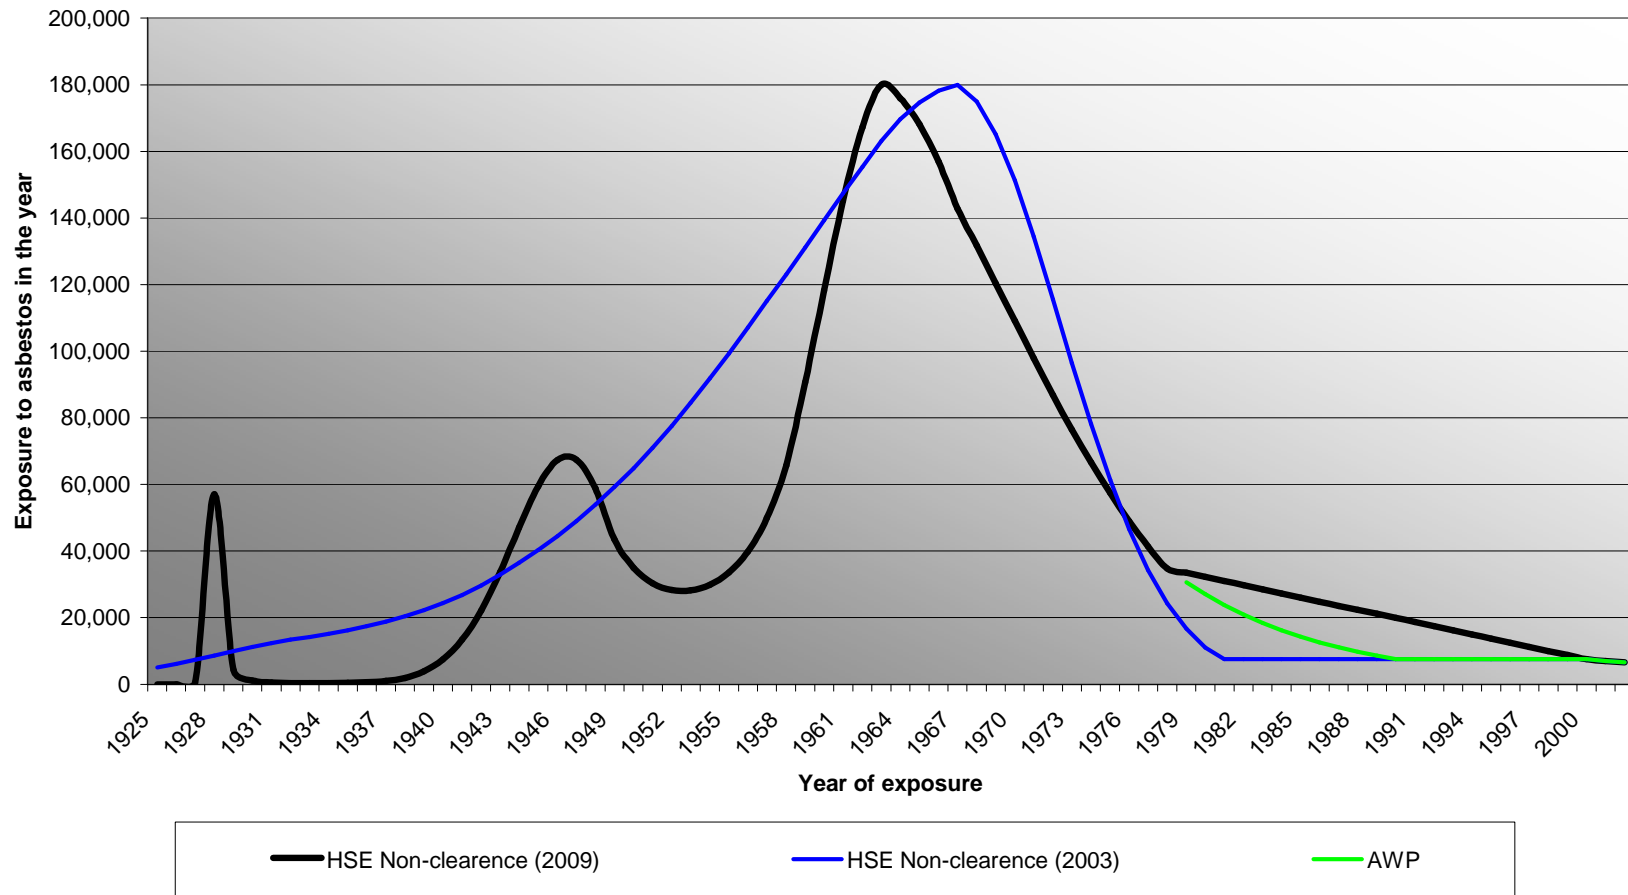

## ***Other scenarios***

- Population – Removing the impact of immigration
- Population – Mortality
  - Claims data shows exposed population experience heavier mortality than GB population

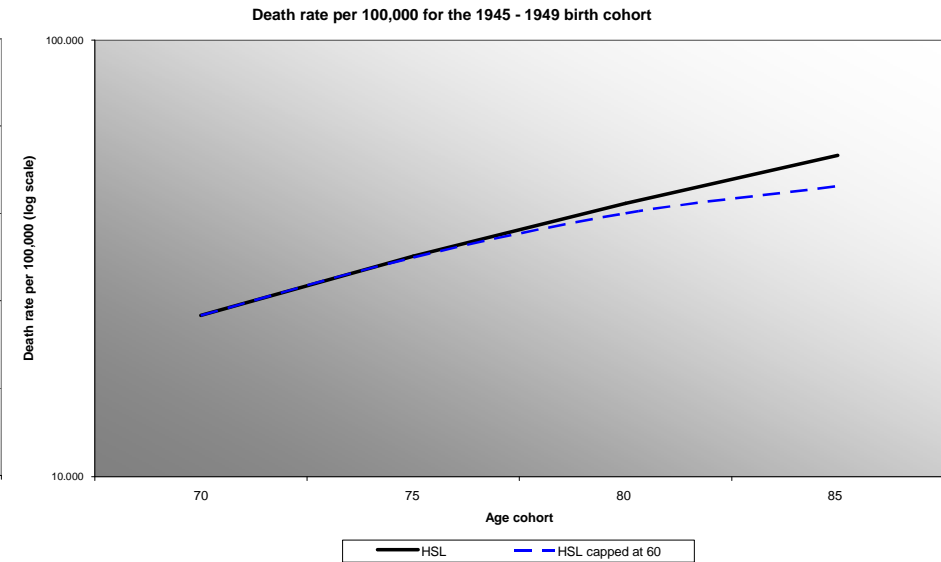

# AWP assumptions – Exposure level

Exposure in year (for 20-29 age band)

# AWP assumptions – Cap on k

# AWP scenarios – Population deaths

Male mesothelioma deaths (includes background deaths)

# Claimants to Deaths Ratio – Historical Trends

# Claimants to Deaths Ratio – Work Undertaken

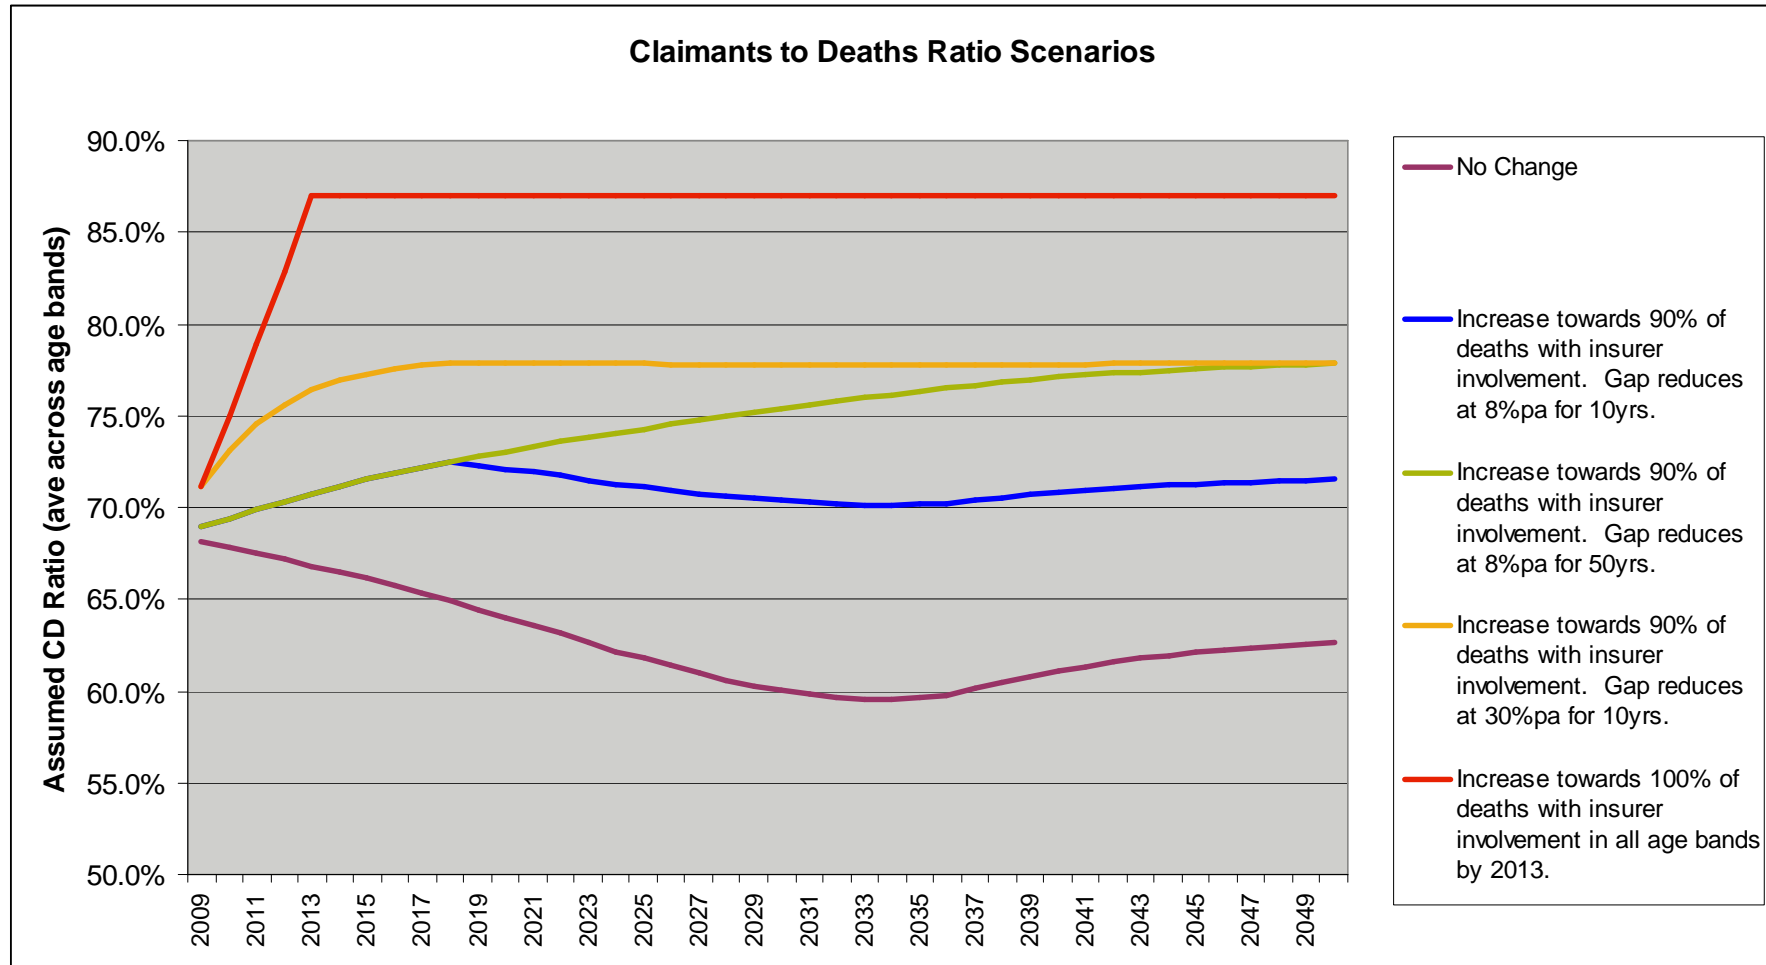

Current position determined by age band

Estimate proportion of deaths with no insured occupational involvement:

- Assume 1% of deaths relate to the armed forces
- Assume 2% of deaths relate to solely self employed individuals
- Assume 10% do not arise out of occupational exposure
- Suggesting 13% of deaths have no insured occupational involvement

The effect of potential changes in future CD ratios were then tested using a number of scenarios.

# Claimants to Deaths Ratio – Scenarios used

# Average Cost Per Claim (ACPC) Model

## Changes since the 2004 Model:

- 2004 AWP assumed only lost income was age related
- 2008 review suggests that further claim elements are age related
- 2008 review also highlighted differences for living and deceased claimants
- Data for around 300 claimants reviewed
- Discussion with claims handlers

# Average Cost Per Claim Model Assumptions

	Age Related	Inflation	Live/Deceased
General Damages (pain / suffering / loss of amenity)	Yes	Court	No
Special Damages (loss of future income)	Yes	Wage	Yes
PWCA	No	RPI	No
CRU	Yes	RPI	Yes
Bereavement award (proxy deceased indicator)	No	RPI	Yes
Funeral costs	No	RPI	Yes
Care costs	No	Wage	No
Misc (travel / medication etc.)	No	RPI	No
Other (interest on pre-settlement expenses / loss of past income)	No	Wage	No
Legal Fees	Yes	Wage	No

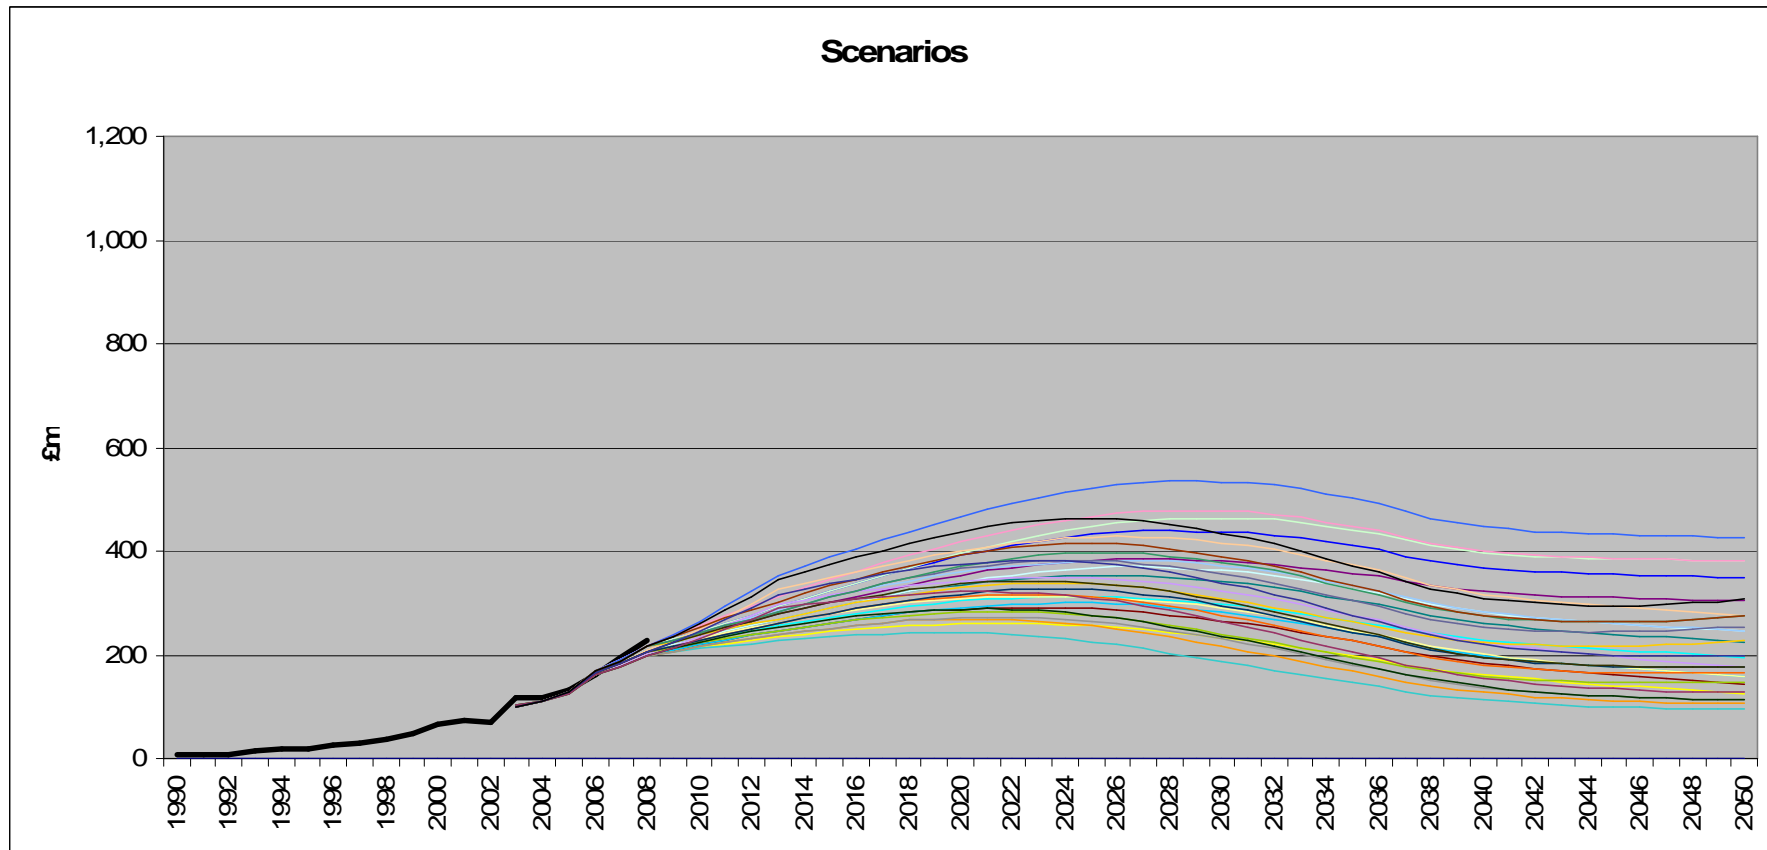

# Draft Mesothelioma scenarios

## 60 Scenarios run:

Population Projections	CD Ratio		RPI
	CD Cap	Progression speed	
HSE Model	No Change	No Change	1.50%
Adjusted HSE Model	90% of claims with insured involvement	gap reduced at 8%pa for 10yrs	2.50%
Birth Cohort Model	90% of claims with insured involvement	gap reduced at 8%pa for 50yrs	3.50%
Latency Model	90% of claims with insured involvement	gap reduced at 30%pa for 10yrs	
	100% of claims with insured involvement	Cap reached by 2013	

# Draft Mesothelioma scenarios

# Draft Mesothelioma scenarios

Incurred Insurance Claim notifications (100% Market)				
£m				
	2004-2008	2009-2040	2041-2050	2009-2050
Estimated 2004 AWP MidMid	417	4,016	0	4,016
Actual	836			
Rebased 2004 AWP MidMid		Approx 8,000	0	Approx 8,000
Estimated 2009 AWP Indication		Approx 8,500	Approx 1,500	Approx 10,000

# Key Uncertainties in Projection

- Future deaths due to mesothelioma very uncertain
- Models unlikely to be reliable beyond 10 years
- Number of people claiming in the future against employers / insurers difficult to predict
- Future inflation could be higher or lower than estimated
- Any point estimate is therefore very subjective

# Non-Meso – Lung Cancer Claim Nos.

# Non-Meso – Lung Cancer Claim Nos.

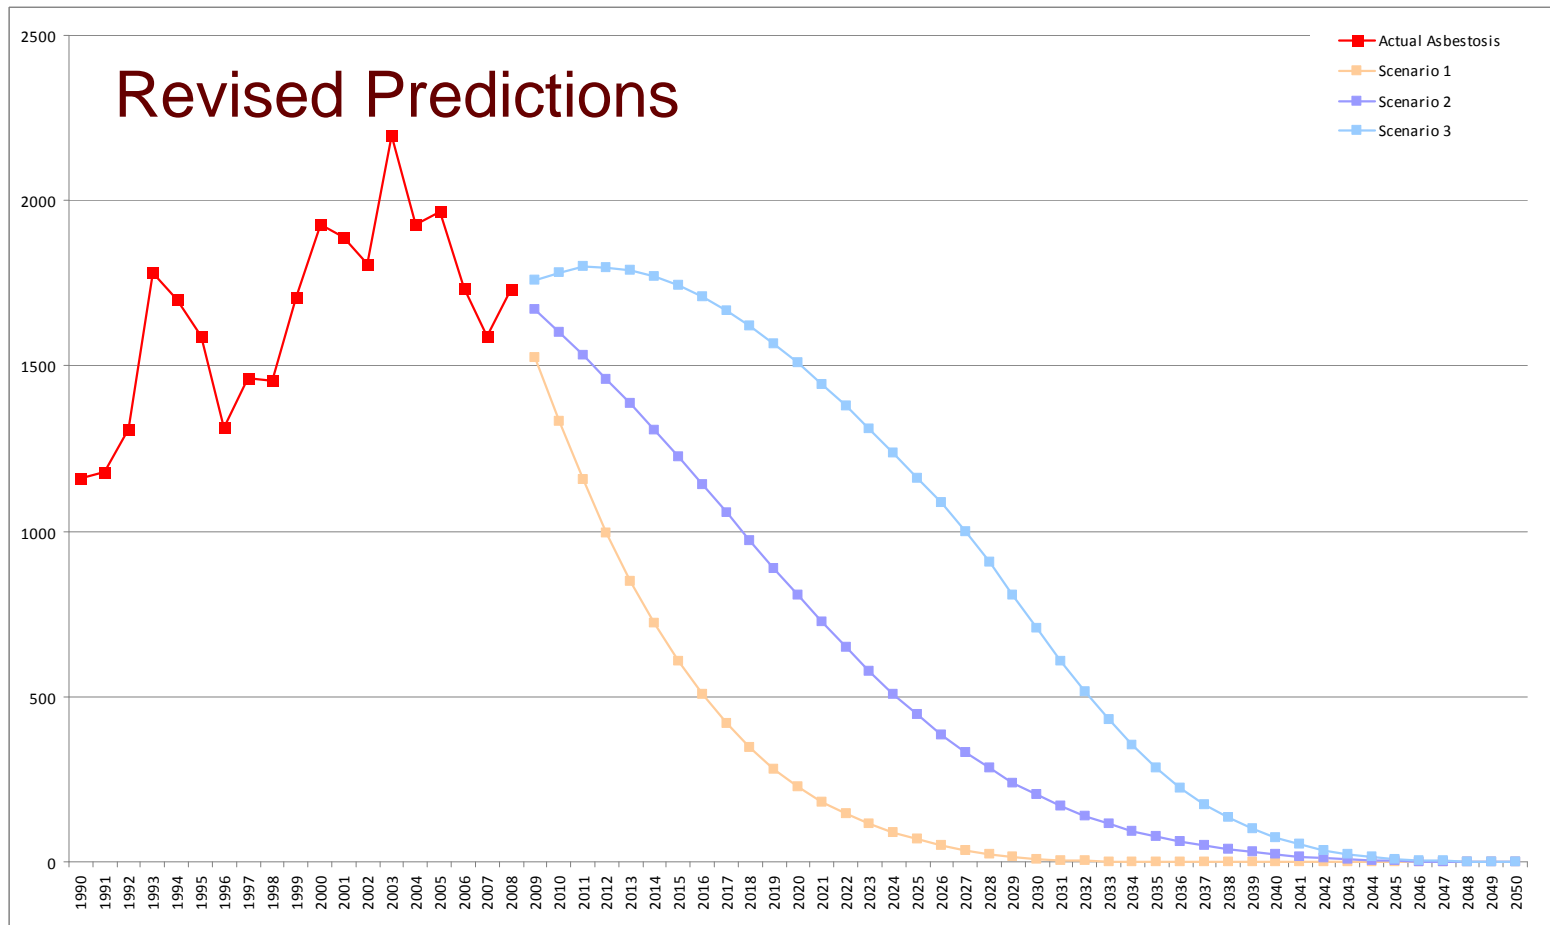

# Lung Cancer Projected Claim Amounts

## Summary Results (£m)

Old Lung Cancer Projections (Post 2009 Claims Only)			Average Cost Per Claim		
			Inflation 1	Inflation 2	Inflation 3
			0%	4%	8%
Claim Numbers	Scenario 1	455	17	26	38
	Scenario 2	1,650	63	<b>115</b>	220
	Scenario 3	2,959	112	264	706

New Lung Cancer Projections			Average Cost Per Claim		
			Inflation 1	Inflation 2	Inflation 3
			1%	3%	5%
Claim Numbers	Scenario 1	3,799	171	201	238
	Scenario 2	8,378	395	<b>512</b>	679
	Scenario 3	19,504	952	1,332	1,913

# Non-Meso – Asbestosis Claim Nos.

# Asbestosis Projected Claim Amounts

## Summary Results (£m)

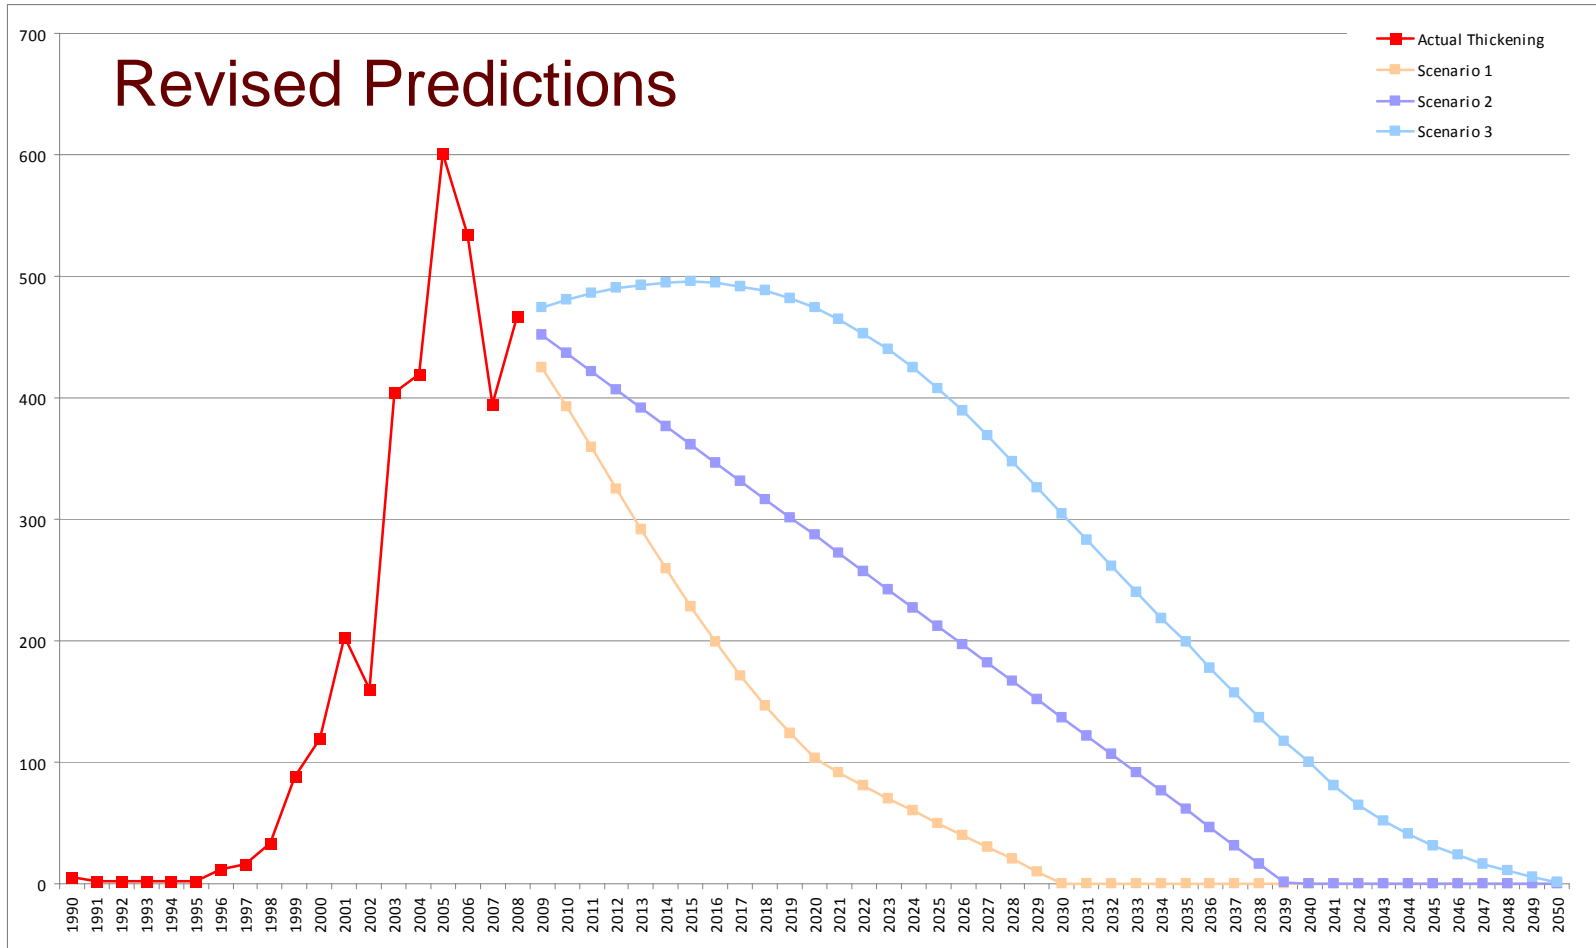

### Old Asbestosis Projections (Post 2009 Claims Only)

			Average Cost Per Claim		
			Inflation 1	Inflation 2	Inflation 3
			1%	3%	5%
Claim Numbers	Scenario 1	15,087	291	378	496
	Scenario 2	20,671	404	<b>539</b>	728
	Scenario 3	32,570	649	902	1,274

### New Asbestosis Projections

			Average Cost Per Claim		
			Inflation 1	Inflation 2	Inflation 3
			1%	3%	5%
Claim Numbers	Scenario 1	9,702	192	216	243
	Scenario 2	20,224	415	<b>503</b>	619
	Scenario 3	34,576	728	932	1,214

# Non-Meso – Thickening Claim Nos.

# Thickening Projected Claim Amounts

## Summary Results (£m)

Old Plaques/Thickening Proj.  
(Post 2009 Claims Only)

			Average Cost Per Claim		
			Inflation 1	Inflation 2	Inflation 3
			1%	3%	5%
Claim Numbers	Scenario 1	900	11	12	14
	Scenario 2	7,900	93	<b>107</b>	122
	Scenario 3	30,900	366	425	491

New Thickening Projections  
Note: Pleural Thickening only

			Average Cost Per Claim		
			Inflation 1	Inflation 2	Inflation 3
			1%	3%	5%
Claim Numbers	Scenario 1	4,176	74	85	98
	Scenario 2	7,024	157	<b>197</b>	253
	Scenario 3	11,986	276	375	522

# Total Non-Meso Projected Claim Amounts

## Summary Results (£m)

Old Non-Meso Projections (Post 2009 Claims Only)			Average Cost Per Claim		
			Inflation 1	Inflation 2	Inflation 3
Claim Numbers	Scenario 1	16,442	319	416	548
	Scenario 2	30,221	560	<b>761</b>	1,070
	Scenario 3	66,429	1,128	1,591	2,471

New Non-Meso Projections excluding pleural plaques			Average Cost Per Claim		
			Inflation 1	Inflation 2	Inflation 3
			1%	3%	5%
Claim Numbers	Scenario 1	17,676	437	501	579
	Scenario 2	35,625	966	<b>1,213</b>	1,550
	Scenario 3	66,066	1,957	2,639	3,648

# Pleural Plaques

- Government in England and Wales have not yet made an announcement following the consultation paper.
- Scottish Government has legislated to make pleural plaques compensable.
- This decision is currently under Judicial Review.
- Large uncertainty in respect of potential pleural plaques claims.
- Working Party has not estimated an insurance market cost for pleural plaques.
- Estimate a cost only if they are deemed compensable in the future.

# Summary

- DRAFT UK asbestos insurance market estimates.
- Final report in the next couple of months.
- Reserving Actuaries need apply their own judgement.
